470 S Sandusky St, Delaware, Ohio 43015 Phone: (740) 368-1700 Fax: (740) 368-1736

Date Received:	 Property Owner:	
Property Address		

Indicates plan meets ODH & DPHD requirements	YES	NO	N/A
Site and Soil Survey			
Do the plans match the calculations			
Notes Required			
Designation in notes that the designer is available to make adjustments and address concerns, as			
needed			
O&M requirements noted or provided			
Designation of any other obstructions			
Designation in notes that homeowner has been informed of system options and cost			
Designation in notes to contact designer before making changes to the design			
Designation in notes for protection of primary and replacement areas			
Date designer and/or designee visited the site			
Installation instructions			
29-05			
Site review fee paid			
Plan review fee paid			
29-06			
No unapproved connections to STS (e.g. roof, foundation, clear water sump, swimming pool, etc.)			
System is non-discharging			
10' isolation distances (utility line, roadway, driveway, property line, right-of-way, sealed well, recorded easement,			
intermittent stream, swale, geothermal horizontal closed loop, irrigation line, GWRS, hardscape, etc.)			
50' isolation distances (surface water impoundment, lake, river, wetland, perennial stream, road cut-bank, stream cut-			
bank, water supply source, vertical open and closed loop geothermal, etc.)	+		
STS sited on lot	+		-
STS not in floodway, or wetland	+		-
If within 100 year flood plain, STS is below grade	+		
Sanitary sewer not accessible			
29-07		1	
Soils submitted by qualified individual	+		-
Limiting conditions described and noted	+		
Depth to limiting layer adequate	+		-
Depth to restrictive layer adequate	+		-
Soil horizons and depth indicated	+		-
Soil texture and structure of each horizon indicated	+		-
Slope and contours indicated	+		-
Basal loading rate and linear loading rate are appropriate for soils utilized	+		
Soil classifications	+		
Highly permeable soil identified			
29-10 House plan provided (with bedrooms)			
	+		
Daily design flow (with anticipated variations)	+-	$\vdash$	-
Plan view	+-	-	
Rationale for design, if differing from standards	+-	-	
Description of treatment process	1		

Topography, scale, and north arrow provided	
Elevations (house, tanks, pumps, beginning/middle/end of distribution area etc.)	
Dimensions of property	
Pump info/pump curve	
Pressure distribution network with description and calculations	
Product info (Materials, Components, Tank Sizes, etc.)	
Length and width of treatment areas adequate	
Designation of primary and secondary treatment area mapped on plan	
Adequate access for O&M equipment provided	
Designation of hardscapes, easements, disturbed areas, soil boring locations, wooded areas, and	
notable areas of concern mapped on plan	
29-12	
Tank size adequate	
Tank approved by ODH	
Dosing tank accommodates reserve and/or surge capacity	
Pump properly sized and provided with accessible quick disconnect	
Air vacuum release valve (needed if pump fitting or transport line is at a higher elevation than soil absorption	
component.)	
Switches, controls, alarms and electrical devices are in an easily accessible location	
Control panels and alarms on exterior and 1 foot above grade	
Building sewer-no angles >45 degrees, 1-10% elevation change in pipe, and cleanout provided	
Additional cleanouts indicated when needed (over 75' and every 100' thereafter)	
29-13	
Pretreatment components have effluent sampling capability after pretreatment	
If depth ≤ 2′, 8″ spacing between inlet and outlet pipe	
If depth >2' but ≤6', 12" spacing between inlet and outlet pipe	
At least 2" elevation difference from inlet to outlet	
At least 2 elevation difference from inlet to outlet	
29-14	
29-14	
<b>29-14</b> Pretreatment device utilized for depth credit meets standards for selected depth credit	
29-14 Pretreatment device utilized for depth credit meets standards for selected depth credit 29-15	
29-14 Pretreatment device utilized for depth credit meets standards for selected depth credit 29-15 Limiting condition not specified-VSD-18" In situ-8"

Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ- 12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals	
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals  When flow restrictive layer within 12" of surface, Dose 1/8 design flow & 3 times void	
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals  When flow restrictive layer within 12" of surface, Dose 1/8 design flow & 3 times void  If zoned, dosing equal	
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals  When flow restrictive layer within 12" of surface, Dose 1/8 design flow & 3 times void  If zoned, dosing equal  If time dosed, dosing spaced uniformly throughout the day	
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8" Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12" Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing If a reduction for an existing lot is utilized, an explanation of need is provided Oriented parallel to natural contour Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals When flow restrictive layer within 12" of surface, Dose 1/8 design flow & 3 times void If zoned, dosing equal If time dosed, dosing spaced uniformly throughout the day Direction of orifices and method for shielding designated	
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals  When flow restrictive layer within 12" of surface, Dose 1/8 design flow & 3 times void  If zoned, dosing equal  If time dosed, dosing spaced uniformly throughout the day  Direction of orifices and method for shielding designated  Orifice number and spacing provide distribution of no more than 6 sq. ft. per orifice	
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals  When flow restrictive layer within 12" of surface, Dose 1/8 design flow & 3 times void  If zoned, dosing equal  If time dosed, dosing spaced uniformly throughout the day  Direction of orifices and method for shielding designated  Orifice number and spacing provide distribution of no more than 6 sq. ft. per orifice  Orifice size ≥1/8", ≥6" from end of lateral and ≤ 6' apart	
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals  When flow restrictive layer within 12" of surface, Dose 1/8 design flow & 3 times void  If zoned, dosing equal  If time dosed, dosing spaced uniformly throughout the day  Direction of orifices and method for shielding designated  Orifice number and spacing provide distribution of no more than 6 sq. ft. per orifice  Orifice size ≥1/8", ≥6" from end of lateral and ≤ 6' apart  Method for uniform stream dispersal from orifice noted (shielding/spash plate etc.)	
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals  When flow restrictive layer within 12" of surface, Dose 1/8 design flow & 3 times void  If zoned, dosing equal  If time dosed, dosing spaced uniformly throughout the day  Direction of orifices and method for shielding designated  Orifice number and spacing provide distribution of no more than 6 sq. ft. per orifice  Orifice size ≥1/8", ≥6" from end of lateral and ≤ 6' apart  Method for uniform stream dispersal from orifice noted (shielding/spash plate etc.)  Inspection port in each pressure leaching trench with 4" opening	
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals  When flow restrictive layer within 12" of surface, Dose 1/8 design flow & 3 times void  If zoned, dosing equal  If time dosed, dosing spaced uniformly throughout the day  Direction of orifices and method for shielding designated  Orifice number and spacing provide distribution of no more than 6 sq. ft. per orifice  Orifice size ≥1/8", ≥6" from end of lateral and ≤ 6' apart  Method for uniform stream dispersal from orifice noted (shielding/spash plate etc.)	

Shutoff mechanism provided			
29-16 If utilized during design			
STS 8' from drain tiles			
Interceptor drain, if used 6' upslope			
Perimeter drain, if used 6' upslope 8' elsewhere			
Perimeter drain at least 8' from mound lateral or 1 ' from toe			
Subsurface drainage 4" in diameter			
Subsurface drainage at least 10" of coarse aggregate			
Subsurface drainage positive slope of 1/10' per 100'			
Engineered drainage shows depth to seasonal water with and without drainage			
Drainage outlet-accessible, rigid wall, animal guard			
Drainage outlet-sufficient freeboard-at least 4" above water level			
Drainage outlet-permission received for discharge point, when applicable			
MOUND			
VSD matches soil report			
Surface water diversion addressed, as needed			
If many boulders or trees are present, additional area incorporated to compensate			
If more than 5% slope, downslope is free of disturbances			
If less than 5% slope, radial areas free of disturbances			
Sand fill depth not less than 4" with pretreatment, not less than 6" with septic effluent			
Loading rate does not exceed 1g/sqft			
Geotextile fabric/straw provided			
Settled cover at least 6" depth and crowned to promote runoff no steeper than 3:1			
Network calculations provided			
Distribution media at least 3" below pipe and 1" above pipe			
Force main installed upslope side
